Abs Jour : Ref Zhur-Biol., No 13, 1958, 57149

Abstract : and the chondriome of the liver was conducted in normal and experimental embryos 7.5 days after incubation. In all groups a considerable decrease in the sizes of the embryos as compared with normal was noted. Underdeveloped eyes were found in the first group; an absence of eyes and upper facial part of the head was observed in the second group; overdeveloped eyes were found in the third group; finally in the last group an absence of eyes and the upper facial part of the head was noted. Correspondingly, a decrease of the liver chondriome was observed in the first group, a complete absence of the chondriome was found in the second and fourth groups, and a considerable decrease in the 3rd group. Thus, the removal of the prosencephalon evoked an inconsiderable disturbance

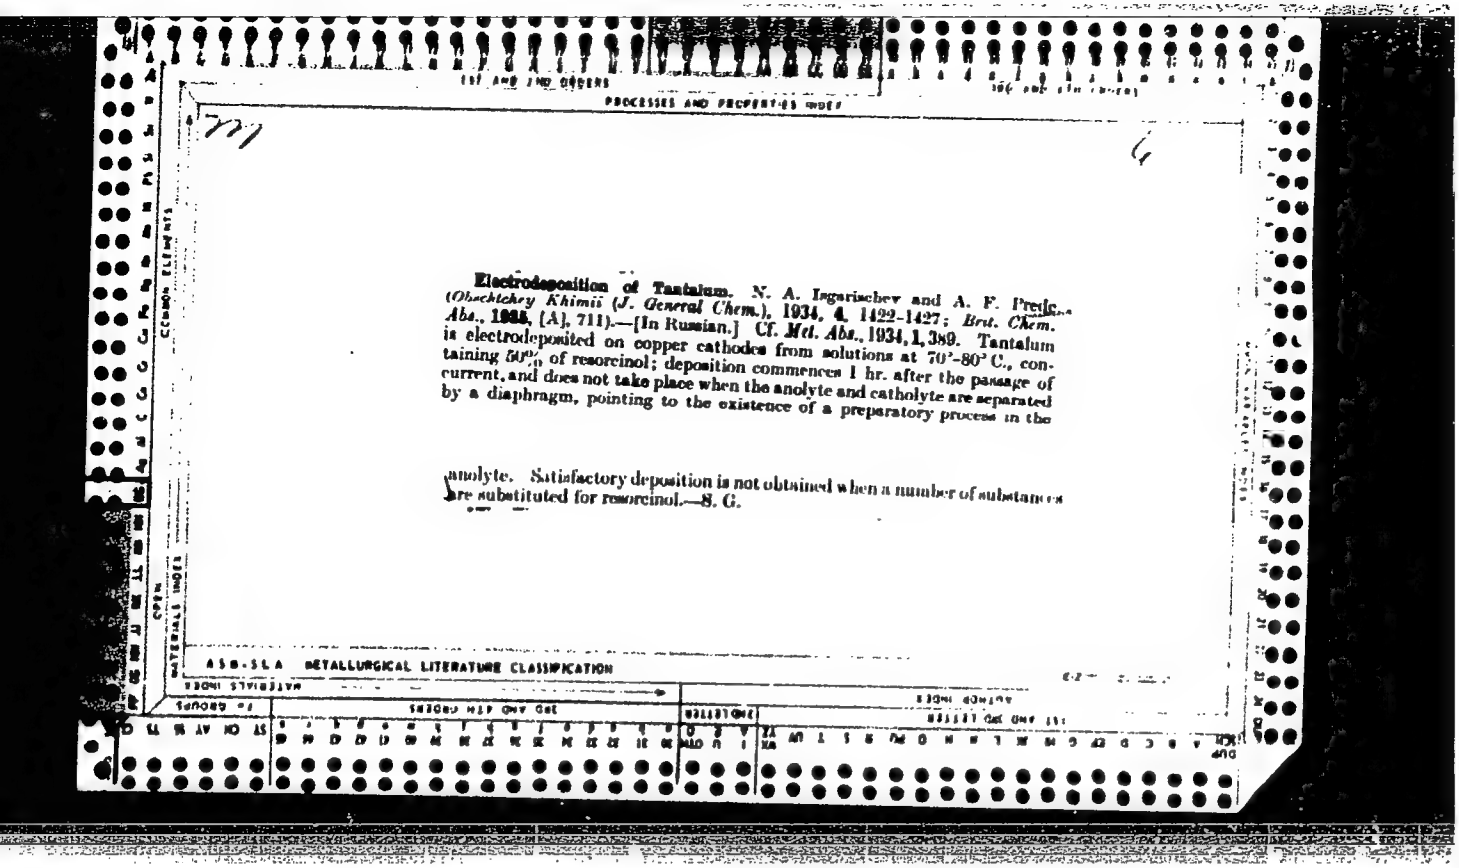
***On the Electrolytic Deposition of Metallic Niobium and Its Separation from Tantalum.** N. A. Isgarischev and A. F. Prede (*Redkie Metally* (*Rare Metals*), **1933**, (2), 41–47).—[In Russian.] From a solution of 1·128 grm. Ta_2O_5 and 0·872 grm. Nb_2O_5 in 150 c.c. of 40% KOH containing 3% dextrin, a bright, firm deposit of pure Nb was obtained, at a current efficiency of 0·06% with 0·25 amp./cm.^{2} at 4 v. at 100° C. A poorer plate was obtained by fusing 0·564 grm. Ta_2O_5 and 0·436 grm. Nb_2O_5 with $K_2S_2O_7$, dissolving the melt in 75 c.c. of saturated $(NH_4)_2C_2O_4$ and 5 c.c. of saturated $H_2C_2O_4$ solution and electrolyzing with 0·15 amp./cm.^{2}, at 3–4 v., at 75°–80° C. From a similar solution in 100 c.c. of 60% citric acid at 0·15 amp./cm.^{2}, and at above 80° C. a good Nb plate was obtained; the method is applicable to the electro-analysis of Nb.—D. N. S.

APPROVED FOR RELEASE: Tuesday, August 01, 2000 CIA-RDP86-00513R0013429

"APPROVED FOR RELEASE: Tuesday, August 01, 2000 CIA-RDP86-00513R001342



Electrodeposition of Tantalum. N. A. Ingarischev and A. F. Predic... (*Obschtchey Khimii* (*J. General Chem.*), 1934, **4**, 1422–1427; *Brit. Chem. Abs.*, 1935, (A), 711).—[In Russian.] Cf. *Met. Abs.*, 1934, **1**, 389. Tantalum is electrodeposited on copper cathodes from solutions at 70°–80° C., containing 50% of resorcinol; deposition commences 1 hr. after the passage of current, and does not take place when the anolyte and catholyte are separated by a diaphragm, pointing to the existence of a preparatory process in the anolyte. Satisfactory deposition is not obtained when a number of substances are substituted for resorcinol.—S. G.

Electrodeposition of metallic niobium, and its separation from tantalum. N. A. Isgarishchev and A. F. Panna (J. Gen. Chem. Russ., 1933, 3, 831—838).—Mixtures of Ta_2O_5 and Nb_2O_5 are fused with $K_2S_2O_7$, and the melt is dissolved in 40% KOH, or in saturated aq. $H_2C_2O_4$, or citric acid. On electrolysis of these solutions, Nb is deposited quantitatively on the cathode, in the form of a bright, smooth, adherent coating. The industrial possibilities of Nb plating are discussed. R. T.
